## **SOFTWARE**

---

### *R packages*

1. DIQIF: Performs joint integrative regression analysis of multiple data sources with correlated vector outcomes. Regression parameters from each data source are estimated using quadratic inference functions, and parameters are selectively combined following a pre-specified partition using a meta-estimator similar in spirit to Hansen's generalized method of moments.
2. DDIMM: Performs doubly distributed and integrated method of moments regression for high-dimensional correlated responses. Outcomes and subjects are divided into blocks that are analysed using composite likelihood or generalized estimating equations. Block estimates are combined using a meta-estimator similar in spirit to Hansen's generalized method of moments.
3. DIMM: Performs distributed and integrated method of moments regression for high-dimensional correlated responses. Divides outcomes into blocks, analyses blocks

using composite likelihood, and combines estimators using a one-step update or an optimal generalized method of moments (GMM).
